CLAIMS

- 1) A unit (1) for forming a molten glass bead (2), the unit (1) comprising a fixed supporting frame (4); a guide (11) integral with said frame (4) and having a substantially vertical axis (12); a slide (13) fitted in axially-sliding manner to said guide (11) and supporting at least one feed punch (6) parallel to said axis (12); and actuating means (10) for moving the slide (13) cyclically in both directions along the guide (11); characterized in that said actuating means (10) comprise a linear electric motor (15).
 - 2) A unit as claimed in Claim 1, characterized in that said linear electric motor (15) comprises a fixed member (16) connected integrally to said frame (4); and a translating member (17) connected to said fixed member (16) and connected integrally to said slide (13) to move in unison with the slide (13).
- 3) A unit as claimed in Claim 2, characterized in 20 that said slide (13) is connected directly to said translating member (17).
 - 4) A unit as claimed in Claim 2, characterized in that said fixed member (16) extends alongside and parallel to said guide (11), and is spaced transversely apart from the axis (12) of the guide (11).
 - 5) A unit as claimed in Claim 2, characterized in that said slide (13) and said translating member (17)

extend substantially along a common vertical axis (12) of travel.

- 6) A unit as claimed in Claim 5, characterized in that said slide (13) and said translating member (17) are aligned with each other along said common axis (12) of travel.
 - 7) A unit as claimed in Claim 5, characterized in that said common axis coincides with the axis (12) of said guide (11).
